Re: LNG Export Study and Request for Comment

Dear Department of Energy,

We ask the Department of Energy revise the four scenarios with additional factors incorporated into the decision making process.

We agree with Senator Wyden, who said the study needs “more realistic market assumptions” than the 2010 market report it was based on. Wyden also found that the Department of Energy (“DOE”) study fails to “consider the significant domestic demand growth,” such as use of natural gas as a transportation fuel used by heavy trucks, public transportation, and the railroad industry.

Senator Wyden concludes the DOE study “is not an adequate basis upon which to approve” individual applications, such as the Jordan Cove proposed export facility or the Pacific Connector Pipeline. We ask the Department of Energy revise the four scenarios with these factors incorporated into the decision making process.

In addition, some applications may be more suitable than others, and inviting public comment on the individual applications will give the DOE a better gauge of awareness for the suitability, viability, and success of the individual projects.

Thank you for considering our comment.

Mary Altmann and Family
